Assignment II

Ques. Write down logical representations for following :-

- Horses, cows and pigs are mammals

$$\text{Horse}(x) \Rightarrow \text{Mammal}(x)$$

$$\text{Cow}(n) \Rightarrow \text{Mammal}(n)$$

$$\text{Pig}(x) \Rightarrow \text{Mammal}(x).$$

- An offspring of a horse is a horse

$$\text{Offspring}(x, y) \wedge \text{Horse}(y) \Rightarrow \text{Horse}(x)$$

- Bluebeard is a horse

$$\text{Horse}(\text{Bluebeard})$$

- Bluebeard is Charlie's parent

$$\text{Parent}(\text{Bluebeard}, \text{Charlie})$$

- Offspring and parent are inverse relations

$$\text{Offspring}(x, y) \Rightarrow \text{Parent}(y, x).$$

$$\text{Parent}(y, x) \Rightarrow \text{Offspring}(x, y)$$

- Every Mammal has a parent

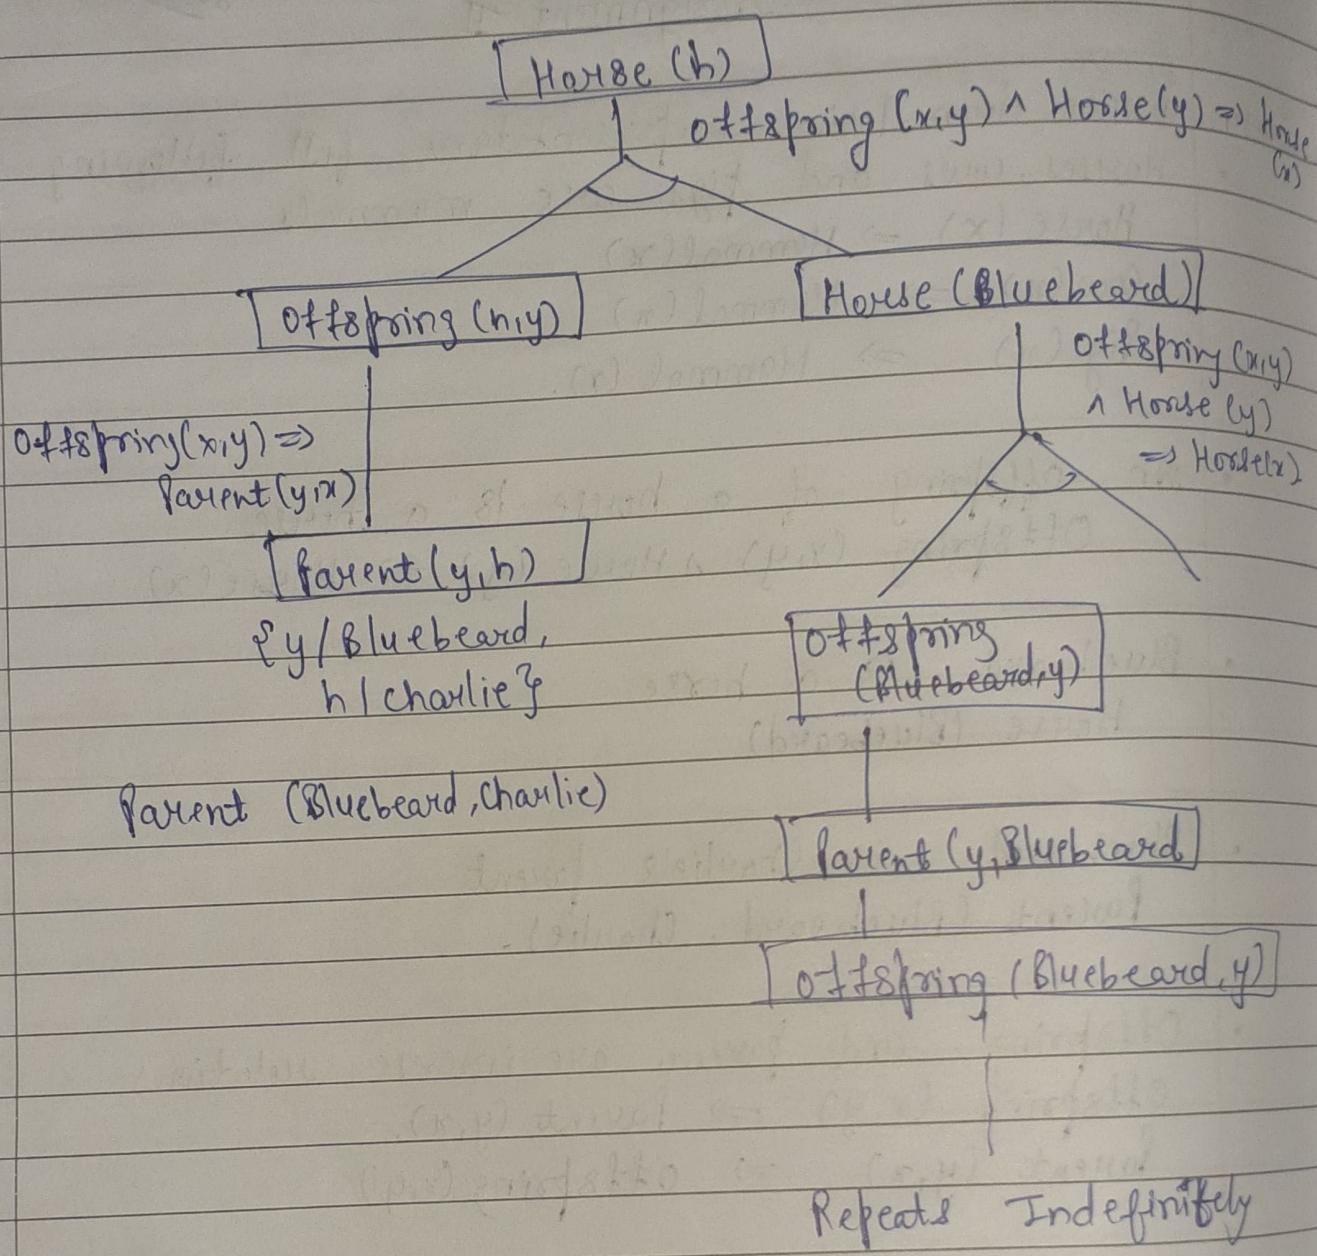

$$\text{Mammal}(n) \Rightarrow \text{Hasparent}(x)$$

Draw the proof tree generated by exhaustive backward chaining algorithm for query

Ex $\text{Horse}(h)$, where clauses are matched in order given

Ques-2

- (a) Translate these sentences into formulas in Predicate logic.
- John likes all kinds of food.
 $\forall x \text{ food}(x) \Rightarrow \text{Like}(\text{John}, x)$.
 - Apples are food.
 $\text{food}(\text{apples})$
 - Chicken is food.
 $\text{food}(\text{chicken})$
 - Anything anyone eats and isn't killed by is food.
 $\forall x \forall y \text{ eats}(y, x) \wedge \text{alive}(y) \Rightarrow \text{food}(x)$
 - Bill eats peanuts and is still alive.
 $\text{eats}(\text{Bill}, x) \Rightarrow \text{eats}(\text{Bill}, \text{peanuts}) \wedge \text{alive}(\text{Bill})$.
 - Sue eats everything Bill eats.
 $\forall x \text{ eats}(\text{Bill}, x) \Rightarrow \text{eats}(\text{Sue}, x)$.

(b) Show that John likes peanuts using backward chaining

$$\forall x \text{ food}(x) \Rightarrow \text{like}(\text{John}, x) \quad \rightarrow ①$$

$$\text{food}(\text{apples})$$

$$\text{food}(\text{chicken})$$

 $\rightarrow ②$ $\rightarrow ③$

$$\forall x \forall y \text{ eats}(y, x) \wedge \text{alive}(y) \Rightarrow \text{food}(x) \quad \rightarrow ④$$

$$\text{eats}(\text{Bill}, \text{peanuts}) \wedge \text{alive}(\text{Bill}) \quad \rightarrow ⑤$$

$$\forall x \text{ eats}(\text{Bill}, x) \rightarrow \text{eats}(\text{Sue}, x) \quad \rightarrow ⑥$$

In Backward chaining, we will start with our goal Predicate which is Likes (John, Peanuts)

St 2

Likes (John, Peanuts)

Using eg ①

Likes (John, Peanuts)

Peanuts/x³

Food (Peanuts)

Now, using (eg ①),
eats (y, Peanuts) & alive (y)

Likes (John, Peanuts)

Food (Peanuts) Peanuts/x³

eats (y, Peanuts)

alive (y)

eats (Bill, Peanuts)

alive (Bill)

Bill/y³So, formed \Rightarrow John Likes Peanuts.

(c)

Convert formulas into clause form

- food (x) \vee Likes (John, x)
- food (Apples)
- food (chicken)

- $\neg \text{eats}(y_1, x) \vee \text{alive}(y_1) \vee \text{food}(x)$
- $\text{eats}(\text{Bill}, \text{Peanuts})$
- $\text{Alive}(\text{Bill})$
- $\neg \text{eats}(\text{Bill}, x) \vee \text{eats}(\text{Sue}, x)$.

(d) Prove that John likes Peanuts using resolution.
Rename variables:

$$\neg \text{food}(x_1) \vee \text{likes}(\text{John}, x_1)$$

Food (Apple)

Food (Chicken)

$$\neg \text{eats}(y_1, x_2) \vee \text{alive}(x_2) \vee \text{food}(y_1)$$

$$\neg \text{eats}(\text{Bill}, \text{Peanuts}) \vee \neg \text{alive}(\text{Bill})$$

$$\neg \text{eats}(\text{Bill}, x_3) \vee \text{eats}(\text{Sue}, x_3)$$

More : "John likes Peanuts"

$$\neg \text{likes}(\text{John}, \text{Peanuts})$$

$$\neg \text{likes}(\text{John}, \text{Peanuts})$$

$$\neg \text{food}(x_1) \vee \text{likes}(\text{John}, x_1)$$

(Peanuts / x_1)

$$\neg \text{eats}(y_1, x_2) \vee \text{alive}(x_2)$$

$$\neg \text{food}(\text{Peanuts})$$

$$\vee \text{food}(y_1)$$

(Peanuts / y_1)

$$\text{eats}(\text{Peanuts}, \text{Bill}) \wedge \text{alive}(\text{Bill}) \quad \neg \text{eats}(\text{Peanuts}, x_2) \wedge \text{alive}(x_2)$$

(Bill / x_2)

? q.

[Hence proved]

(e) Use resolution to answer: "What food does Sue eat?"

Sue eats (Sue, x)

eats (Sue, x) \vee eats (Bill, x) \vee eats (Bill, Peanuts)

eats (Bill, x) \vee eats (Bill, Peanuts)

(Peanuts/x)

2 3

So, Sue eats Peanuts.

eats (Sue, Peanuts)

Ques-3

(a) Represent facts in Predicate logic!

- Member (Elm St. Bridge Club, Joe)
- member (Joe, Club)
- member (Sally, Club)
- member (Bill, Club)
- member (Ellen, Club)
- marriedTo (Joe, Sally)
- brother (Ellen, Bill)
- marriedTo (x, y) \wedge memberOf (x, club) \rightarrow memberOf (y, club)
- lastMeeting (Club, houseof(Joe))

⇒ We can't give resolution proof for 'the last meeting of club was at Sally's house' because there is no rule which indicates that married couple live in same house or indicates that any event occurring in house of a married person also occurs in his/her spouse.

Rule: $\text{MarriedTo}(x,y) \wedge \text{lastMeetingAt}(\text{club}, \text{houseof}(x)) \rightarrow \text{lastMeetingAt}(\text{club}, \text{Houseof}(y)) \quad \text{--- } ⑦$

⇒ We can't establish proof for "Ellen is not Married" because there is no rule indicating that relation and members in club and being unmarried

Rule: $\text{member}(x), \text{member}(y), \neg \text{married}(x,y) \rightarrow \neg \text{MarriedPerson}(y) \quad \text{--- } ⑩$

To Prove :- last meeting of club was at Sally's house
 Goal: $\text{lastMeetingAt}(\text{club}, \text{Houseof}(\text{sally}))$

equations:-

$\text{member}(\text{club}, \text{Joe}) \quad \text{--- } ①$

$\text{member}(\text{club}, \text{sally}) \quad \text{--- } ②$

$\text{member}(\text{club}, \text{Bill}) \quad \text{--- } ③$

$\text{member}(\text{club}, \text{ellen}) \quad \text{--- } ④$

$\text{marriedTo}(\text{Joe}, \text{sally}) \quad \text{--- } ⑤$

$\text{Brother}(\text{ellen}, \text{Bill}) \quad \text{--- } ⑥$

$\text{marriedTo}(x,y) \wedge \text{memberOf}(x, \text{club}) \rightarrow \text{memberOf}(y, \text{club})$ — (7)

$\text{lastMeetingAt}(\text{club}, \text{Houseof}(\text{Joe}))$ — (8)

Convert eq (8) into clause form.

$\neg \text{MarriedTo}(x,y) \vee \neg \text{lastMeetingAt}(\text{Club}, \text{Houseof}(x)) \vee \text{lastMeetingAt}(\text{Club}, \text{Houseof}(y))$ — (9)

Negate the goal

$\neg \text{lastMeetingAt}(\text{club}, \text{Houseof}(\text{Sally}))$ — (10)

from (5) and (9),

$\text{marriedTo}(\text{Joe}, \text{Sally}) \quad \neg \text{MarriedTo}(x,y) \vee \neg \text{lastMeetingAt}(\text{Club}, \text{Houseof}(x)) \vee \text{lastMeetingAt}(\text{Club}, \text{Houseof}(y))$

$\neg \text{lastMeetingAt}(\text{club}, \text{Houseof}(x)) \vee \neg \text{lastMeetingAt}(\text{club}, \text{Houseof}(y))$

{ $\text{Joe}/x, \text{Sally}/y$ }

$\text{lastMeetingAt}(\text{Club}, \text{HouseOf}(\text{Joe}))$

{ Joe/x }

$\neg \text{lastMeetingAt}(\text{Club}, \text{Houseof}(\text{Sally}))$

$\text{lastMeetingAt}(\text{Club}, \text{Houseof}(y))$

{ y }

Hence Proved

more that ellen is not Married.

Goal: $\neg \text{MarriedPerson}(\text{Ellen})$

Convert eq ⑩ into clause form.

$\neg \text{Member}(x) \vee \neg \text{Member}(y) \vee \text{married}(x, y) \vee \neg \text{MarriedPerson}(y) \rightarrow \text{⑪}$

Negate the goal $\neg \text{MarriedPerson}(\text{Ellen}) \rightarrow \text{⑫}$

From eq ⑩ & ⑪,

$\neg \text{Member}(x) \vee \neg \text{Member}(y) \vee \text{member}(\text{Joe})$
 $\neg \text{marriedTo}(x, y) \vee \neg \text{MarriedPerson}(y)$

$\text{member}(\text{Ellen})$

$\neg \text{Member}(y) \vee \text{marriedTo}(x, y) \vee \text{marriedTo}(\text{Joe}, y) \vee \text{MarriedPerson}(y)$

$\neg \text{MarriedPerson}(\text{Ellen})$

$\text{marriedTo}(\text{Joe}, y) \vee \neg \text{MarriedPerson}(y)$

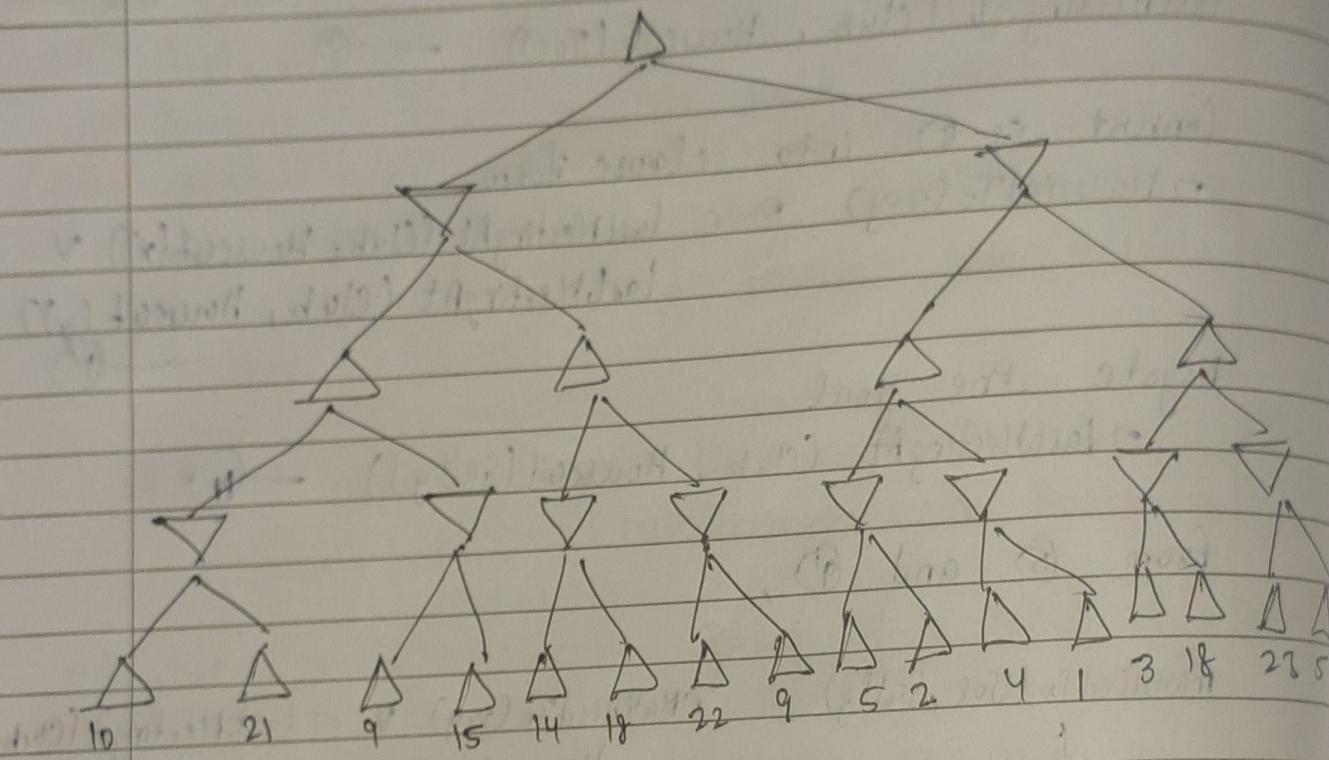

$\text{MarriedTo}(\text{Joe}, \text{Sally})$

$\text{marriedTo}(\text{Joe}, \text{Ellen})$

{ }
Hence proved

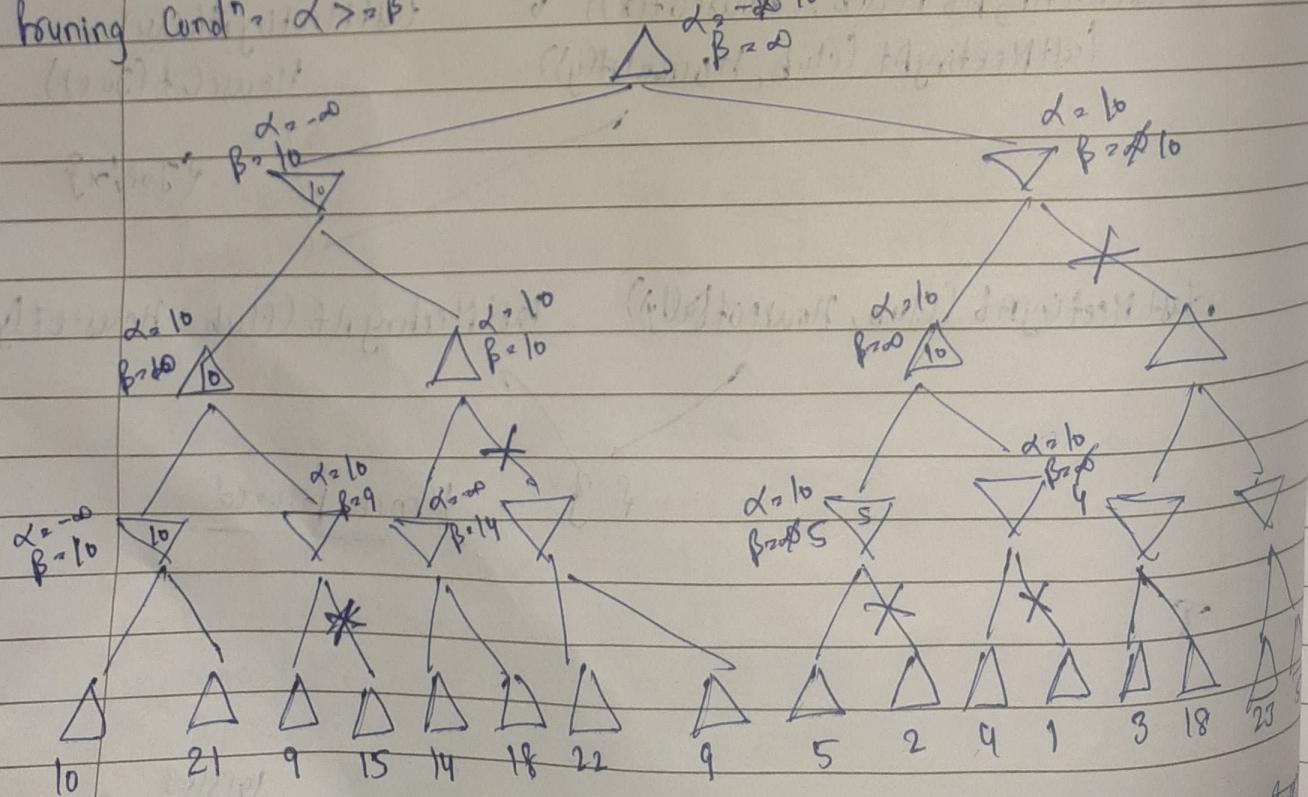

$\Rightarrow \text{Ellen is not Married}$

Ques-4 Apply Alpha-Beta Pruning on following examples

Here, Δ denotes max node which tries to maximize

∇ denotes min node which tries to minimize
Pruning Cond: $\alpha > \beta$

Ques
Ans

A* algorithm is a searching algorithm that searches for shortest path between initial and final state.

function of A* algorithm

$$f(n) = g(n) + h(n) \text{ where}$$

$g(n)$ = cost to reach node n from start state.

$f(n)$ = cost from node n to goal node

$h(n)$ = total cost of cheapest solution.

As the three conditions given in question

I disagree with the statement that A* algorithm may not terminate with shortest path.

A* is complete if:

- \Rightarrow branching factor is finite.
- \Rightarrow cost of each edge is greater than zero
- \Rightarrow heuristic function underestimates the distance to the goal.

This property is known as the admissibility of A*.

An admissible heuristic is optimistic in nature!

If heuristic function is admissible, then A* tree search will find least cost path.
